

1.

a. Set A (3300, 255)

$$3300 = 11 \times 5^2 \times 2^2$$

$$255 = 3 \times 5 \times 17$$

Set B (4205, 332)

$$4205 = 5 \times 29^2$$

$$332 = 2^2 \times 83$$

b. Set A (3300, 255)

$$\text{GCD}(3300, 255) = 3 \times 5 = 15$$

$$\text{LCM}(3300, 255) = 3 \times 5^2 \times 2^2 \times 17 \times 11 = 56100$$

Set B (4205, 332)

$$\text{GCD}(4205, 332) = 1, \text{ since there are no common factors between both the numbers}$$

$$\text{LCM}(4205, 332) = 5 \times 2^2 \times 29^2 \times 83 = 1396060$$

c. Set A (3300, 255)

$$3300 - (12 \times 255) = 240$$

$$255 - (1 \times 240) = 15$$

$$240 - (16 \times 15) = 0$$

$$\text{GCD} = 15$$

Set B (4205, 332)

$$4205 - (12 \times 332) = 221$$

$$332 - (1 \times 221) = 111$$

$$221 - (1 \times 111) = 110$$

$$111 - (1 \times 110) = 1$$

$$\text{GCD} = 1$$

d. Set A (3300, 255)

255 mod 3300 = can't find inverse because they are not relatively prime and the GCD is not equal to 1.

Set B (4205, 332)

332 mod 4205

$$4205 - (12 \times 332) = 221$$

$$332 - (1 \times 221) = 111$$

$$221 - (1 \times 111) = 110$$

$$111 - (1 \times 110) = 1$$

So,

$$1 = 111 - (1 \times 110)$$

$$1 = 111 - (1 \times (221 - (1 \times 111)))$$

$$1 = 111 - (221[1] - 111[1])$$

$$1 = 111 - 221[1] + 111[1]$$

$$1 = 111[2] - 221[1]$$

$$1 = (332 - 221[1])[2] - 221[1]$$

$$1 = 332[2] - 221[2] - 221[1]$$

$$1 = 332[2] - 221[3]$$

$$1 = 332[2] - (4205 - 332[12])[3]$$

$$1 = 332[2] - 4205[3] + 332[36]$$

$$1 = 332[38] - 4205[3]$$

$$1 = 332[38] + 4205[-3]$$

Inverse of 332 mod 4205 = 38

For an inverse to exist the two numbers should be relatively prime

2.

a. 4572 → binary

$$4572 / 2 = 2286 \text{ R0}$$

$$2286 / 2 = 1143 \text{ R0}$$

$$1143 / 2 = 571 \text{ R1}$$

$$571 / 2 = 285 \text{ R1}$$

$$285 / 2 = 142 \text{ R1}$$

$$142 / 2 = 71 \text{ R0}$$

$$71 / 2 = 35 \text{ R1}$$

$$35 / 2 = 17 \text{ R1}$$

$$17 / 2 = 8 \text{ R1}$$

$$8 / 2 = 4 \text{ R0}$$

$$4 / 2 = 2 \text{ R0}$$

$$2 / 2 = 1 \text{ R0}$$

$$1 / 2 = 0 \text{ R1}$$

Binary value = 1000111011100

1000111011100 → octal

001 000 111 011 100

421 421 421 421 421

1 0 4+2+1 2+1 4

1 0 7 3 4

Octal = 10734

8421 8421 8421 8421

1 1 13 12

10 → A

11 → B

12 → C

13 → D

14 → E

15 → F

16 → G

Hexadecimal = 11DC

b. Let's assume p is prime and $p = 97$

Let $a = 2$ as it is not divisible by p and is relatively prime to p

$$a^{(p-1)} = 1 \pmod{p}$$

$$2^{(97-1)} = 1 \pmod{97}$$

$$2^{96} = 1 \pmod{97}$$

Let's use repeated square method

$$= 2^{96}$$

$$= 2^{48^2}$$

$$= 2^{24^2^2}$$

$$= 2^{12^2^2^2}$$

$$= 2^{6^2^2^2^2}$$

$$= 2^{3^2^2^2^2^2}$$

$$= 8^{2^2^2^2^2}$$

$$= 64^{2^2^2^2}$$

$$= 4096^{2^2^2}$$

$$= 16777216^{2^2}$$

$$= (2.815 \times 10^{14})^2$$

$$= 7.92 \times 10^{28}$$

$$= 1 \pmod{97}$$

$$a \equiv b \pmod{n} \quad c \equiv d \pmod{n}$$

$$2^{96} \equiv 1 \pmod{97}$$

$$7.92 \times 10^{28} \equiv 1 \pmod{97}$$

$$2^{96} = 7.92 \times 10^{28}$$

$$2^{96} \equiv 1 \pmod{97}$$

Therefore, 97 is prime

c.

$$\Phi(15)$$

$$\text{Factors} = 5 \times 3$$

$$\text{Numbers coprime } 15 = 1, 2, 4, 7, 8, 11, 13, 14$$

$$\phi(15) = 8$$

$$\Phi(11)$$

$$\text{Factors} = 11$$

$$\text{Numbers coprime to } 11 = 1, 2, 3, 4, 5, 6, 7, 8, 9, 10$$

$$\phi(11) = 10$$

$$\Phi(10)$$

$$\text{Factors} = 2 \times 5$$

Numbers coprime to 10 = 1, 3, 7, 9

$$\phi(10) = 4$$

d.

i. Let $a = 3$ and $p = 97$

$$a^{(p-1)} = 1 \pmod{p}$$

$$2^{(97-1)} = 1 \pmod{97}$$

$$2^{96} = 1 \pmod{97}$$

To find the $3^{2451} \pmod{97}$, we need to find the remainder when 2451 is divided by 96.

$$2451 = (96 \times 25) + 51$$

$$3^{2451} = 3^{(96 \times 25) + 51} = 3^{(96)^{25}} \times 3^{51} \pmod{97}$$

$$\text{Since } 3^{96} = 1 \pmod{97}$$

$$3^{2451} \equiv 1^{25} \times 3^{51} \pmod{97} \equiv 3^{51} \pmod{97}$$

Now we calculate $3^{51} \pmod{97}$

$3^{51} \pmod{97} = 27$ according to wolframalpha since it is a very large number.

FROM THE MAKERS OF WOLFRAM LANGUAGE AND MATHEMATICA

The screenshot shows the WolframAlpha search interface. The input bar contains the expression $3^{51} \pmod{97}$. Below the input bar, there are tabs for "NATURAL LANGUAGE" and "MATH INPUT". A row of mathematical symbols (star, square root, partial derivative, double colon, cube root, infinity, and ellipsis) is visible. Below this is a row of mathematical operators (division, power, square root, cube root, nth root, derivative, second derivative, integral, definite integral, summation, limit, list, and matrix). The "Input" section shows the entered expression $3^{51} \pmod{97}$. The "Results" section shows the output 27.

Since

$$3^{2451} \equiv 3^{51} \pmod{97}$$

$$3^{2451} \equiv 27 \pmod{97}$$

ii. $\phi(120) = \phi(2^3) \times \phi(3) \times \phi(5)$

$$\phi(2^3) = 8$$

$$\phi(3) = 2$$

$$\phi(5) = 4$$

$$\phi(120) = 8 \times 2 \times 4$$

$$= 64$$

Now apply Euler Theorem

$$3^{64} \equiv 1 \pmod{120}$$

Now, we need to find the remainder when 2451 is divided by 64, which is 51. Therefore:

$$3^{2451} = 3^{(64 \times 38) + 19} \pmod{120} \equiv 3^{64 \times 38} \times 3^{19} \pmod{120}$$

$$\text{Since } 3^{64} \equiv 1 \pmod{120}$$

$$3^{2451} \equiv 1^{38} \times 3^{19} \pmod{120}$$

$$\equiv 3^{19} \pmod{120}$$

Now we calculate $3^{19} \pmod{120}$:

$$3^{19} = 9685512 \times 120 + 27$$

$$3^{19} \pmod{120} = 27$$

$$\text{Therefore } 3^{2451} \equiv 27 \pmod{120}$$

e.

$x = 4 \pmod 5$ and $x = 1 \pmod 7$

Given		To Find		M
a1 = 4	m1 = 5	M1	M1^-1	
a2 = 1	m2 = 7	M2	M2^-1	

$M = m1 \times m2$
 $= 5 \times 7$
 $= 35$

$M1 = M/m1$
 $= 35/5$
 $= 7$

$M2 = M/m2$
 $= 35/7$
 $= 5$

$M1 \times M1^{-1} = 1 \pmod{m1}$
 $7 \times M1^{-1} = 1 \pmod 5$
 $7 \times 3 = 1 \pmod 5$
 $M1^{-1} = 3$

$M2 \times M2^{-1} = 1 \pmod{m2}$
 $5 \times M2^{-1} = 1 \pmod 7$
 $5 \times 3 = 1 \pmod 7$
 $M2^{-1} = 3$

$X = (a1 \times M1 \times M1^{-1} + a2 \times M2 \times M2^{-1}) \pmod M$
 $= (4 \times 7 \times 3 + 1 \times 5 \times 3) \pmod{35}$
 $= 99 \pmod{35}$
 $= 29$

$29 = 4 \pmod 5$
 $29 = 1 \pmod 7$

3.

a. Encryption

Let's choose N

$$N = 13$$

$$\begin{aligned} C &= 7P + 6 \bmod 26 \\ &= 7 \times 13 + 6 \bmod 26 \\ &= 97 \bmod 26 \\ &= 19 \\ &= T \end{aligned}$$

Decryption

$$\begin{aligned} P &= (C - 6 \times 7^{-1}) \bmod 26 \\ &= (19 - 6 \times 7^{-1}) \bmod 26 \end{aligned}$$

In order to find 7^{-1} :

$$\begin{aligned} 7x &= 1 \bmod 26 \\ (26, 7) \end{aligned}$$

$$\begin{aligned} 26 - 3 \times 7 &= 5 \\ 7 - 1 \times 5 &= 2 \\ 5 - 2 \times 2 &= 1 \\ 2 - 2 \times 1 &= 0 \end{aligned}$$

$$\begin{aligned} 1 &= 5 + 2[-2] \\ &= 5 + (7 + 5[-1]) [-2] \\ &= 5 + 7[-2] + 5[2] \\ &= 5[3] + 7[-2] \\ &= (26 + 7[-3]) [3] + 7[-2] \\ &= 26[3] + 7[-9] + 7[-2] \\ &= 26[3] + 7[-11] \end{aligned}$$

We need x to be a positive integer, so, we add 26 to the current value

$$\begin{aligned} X &= -11 + 26 \\ &= 15 \end{aligned}$$

Going back to the equation:

$$\begin{aligned} P &= (19 - 6 \times 7^{-1}) \bmod 26 \\ &= (19 - 6 \times 15) \bmod 26 \\ &= (13 \times 15) \bmod 26 \\ &= 195 \bmod 26 \\ &= 13 \\ &= N \end{aligned}$$

b.

In monoalphabetic substitution, the relationship between a symbol in the plaintext to a symbol in the ciphertext is always one-to-one.

In polyalphabetic substitution, the occurrence of a character may have a different substitute. The relationship between character in the plaintext to a character in the ciphertext is one-to-many.

Monoalphabetic substitution includes Caesar cipher, or shift cipher, which is also the additive cipher, affine cipher, and multiplicative cipher. They are very vulnerable to brute force and frequency analysis.

Polyalphabetic substitution includes autokey, Playfair, Vignere cipher, which are generally more resistant to frequency analysis compared to monoalphabetic ciphers due to their varying nature of the substitutions used.

Cryptanalysis is the study of the frequency of letters or groups of letters in a ciphertext. The method is used as an aid to breaking classical ciphers.

If the letter "M" is the most common then it is reasonable to guess that "E" $\rightarrow$ "M" in the cipher because E is the most common letter in the English language.

c.

Let's encrypt A $\rightarrow$ 0th position

First key – 3

Plaintext – A

Shift – A+3

= D $\rightarrow$ 3rd position

Second key – 5

Plaintext – D (from previous step)

Shift – D+5

= I $\rightarrow$ 9th position

In polyalphabetic substitution, the occurrence of a character may have a different substitute. The relationship between character in the plaintext to a character in the ciphertext is one-to-many.

Therefore, encrypting "A" twice with the key 3, 5 results in "I". This shows that Vigenère cipher is polyalphabetic.

d.

Let's encrypt A four times using the $K = \begin{bmatrix} 5 & 3 \\ 4 & 4 \end{bmatrix}$.

$$P = \begin{bmatrix} A & A \\ A & A \end{bmatrix}$$

$$C = P \times K \text{ mod } 26$$

$$\begin{aligned} C &= \begin{bmatrix} A & A \\ A & A \end{bmatrix} \times \begin{bmatrix} 5 & 3 \\ 4 & 4 \end{bmatrix} \text{ mod } 26 \\ &= \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} \times \begin{bmatrix} 5 & 3 \\ 4 & 4 \end{bmatrix} \text{ mod } 26 \\ &= \begin{bmatrix} 0 & 0 \\ 0 & 0 \end{bmatrix} \text{ mod } 26 \\ &= \begin{bmatrix} A & A \\ A & A \end{bmatrix} \end{aligned}$$

The cipher text is same as plaintext because we used the same letter four times, and the multiplication with the key matrix did not change the value.

Incase if we want to demonstrate the poly-alphabetic nature of Hill Cipher, we can use four different letters and see.

Let's encrypt H,E,L,P using the $K = \begin{bmatrix} 5 & 3 \\ 4 & 4 \end{bmatrix}$.

$$P = \begin{bmatrix} H & E \\ L & P \end{bmatrix}$$

$$C = P \times K \text{ mod } 26$$

$$\begin{aligned} C &= \begin{bmatrix} H & E \\ L & P \end{bmatrix} \times \begin{bmatrix} 5 & 3 \\ 4 & 4 \end{bmatrix} \text{ mod } 26 \\ &= \begin{bmatrix} 7 & 4 \\ 11 & 15 \end{bmatrix} \times \begin{bmatrix} 5 & 3 \\ 4 & 4 \end{bmatrix} \text{ mod } 26 \\ &= \begin{bmatrix} 68 & 65 \\ 72 & 76 \end{bmatrix} \text{ mod } 26 \\ &= \begin{bmatrix} 16 & 13 \\ 20 & 24 \end{bmatrix} \text{ mod } 26 \\ &= \begin{bmatrix} Q & N \\ U & Y \end{bmatrix} \end{aligned}$$

Now we can see the poly-alphabetic nature of Hill cipher.

Now let's Decrypt it to see whether the encryption is reversible.

$$P = K^{-1} \times C \text{ mod } 26$$

$$K^{-1} = (1 / \det K) \times \text{adjoint } K \times \text{mod } 26$$

$$\begin{aligned} \det K &= (5 \times 4) - (3 \times 4) \\ &= 8 \end{aligned}$$

$$\text{Adjoint of } K = \begin{bmatrix} 4 & -3 \\ -4 & 5 \end{bmatrix}$$

$$K^{-1} = (1/8) \begin{bmatrix} 4 & -3 \\ -4 & 5 \end{bmatrix} \text{ mod } 26$$

So, in order to find the inverse of (1/8)

$$26 - 3 \times 8 = 2$$

$$8 - 4 \times 2 = 0$$

$$\begin{aligned}
0 &= 8 + 2(-4) \\
&= 8 + (26 + 8(-3))(-4) \\
&= 8 + 26(-4) + 8(12) \\
&= 8(13) + 26(-4)
\end{aligned}$$

So, inverse of (8) is 13,

$$\begin{aligned}
K^{-1} &= 13 [(4, -3), (-4, 5)] \text{ mod } 26 \\
&= 13 [(4, 23), (22, 5)] \text{ mod } 26 \\
&= [(52, 299), (286, 65)] \text{ mod } 26 \\
&= [(0, 13), (0, 13)]
\end{aligned}$$

Now let's find the plaintext

$$\begin{aligned}
P &= K^{-1} \times C \text{ mod } 26 \\
&= [(0, 13), (0, 13)] \times [(A, A), (A, A)] \text{ mod } 26 \\
&= [(0, 13), (0, 13)] \times [(0, 0), (0, 0)] \text{ mod } 26 \\
&= [(0, 0), (0, 0)] \text{ mod } 26 \\
&= [(A, A), (A, A)]
\end{aligned}$$

Since the decrypted matrix is the same as the plaintext, confirming that the encryption and decryption processes are reversible.

Identity matrix:

$$\begin{aligned}
K^{-1} &= (1/8) [(4, -3), (-4, 5)] \text{ mod } 26 \\
&= [(1/2, -3/8), (-1/2, 5/8)]
\end{aligned}$$

$$K = [(5, 3), (4, 4)].$$

$$\begin{aligned}
\text{Identity Matrix} &= K \times K^{-1} \\
&= [(5, 3), (4, 4)] \times [(4/8, -3/8), (-4/8, 5/8)] \\
&= [(1, 0), (0, 1)] \\
&= \text{So, when a key matrix and inverse key matrix are multiplied, it produces the identity matrix.}
\end{aligned}$$
